Food and Agriculture
Organization of the
United Nations

The Author Team

145 experts
from 51 countries

(3 co-chairs
24 coordinating lead
authors
87 lead authors
15 review editors
16 fellows)

& 310 contributing
authors

**~156,000 Hours of
Voluntary Work =
~17 years**

Supported by:
The Global TSU &
other TSUs &
Management
Committee

Hien Ngo (TSU)

Eduardo Brondízio
(co-chair)

Sandra Díaz
(co-chair)

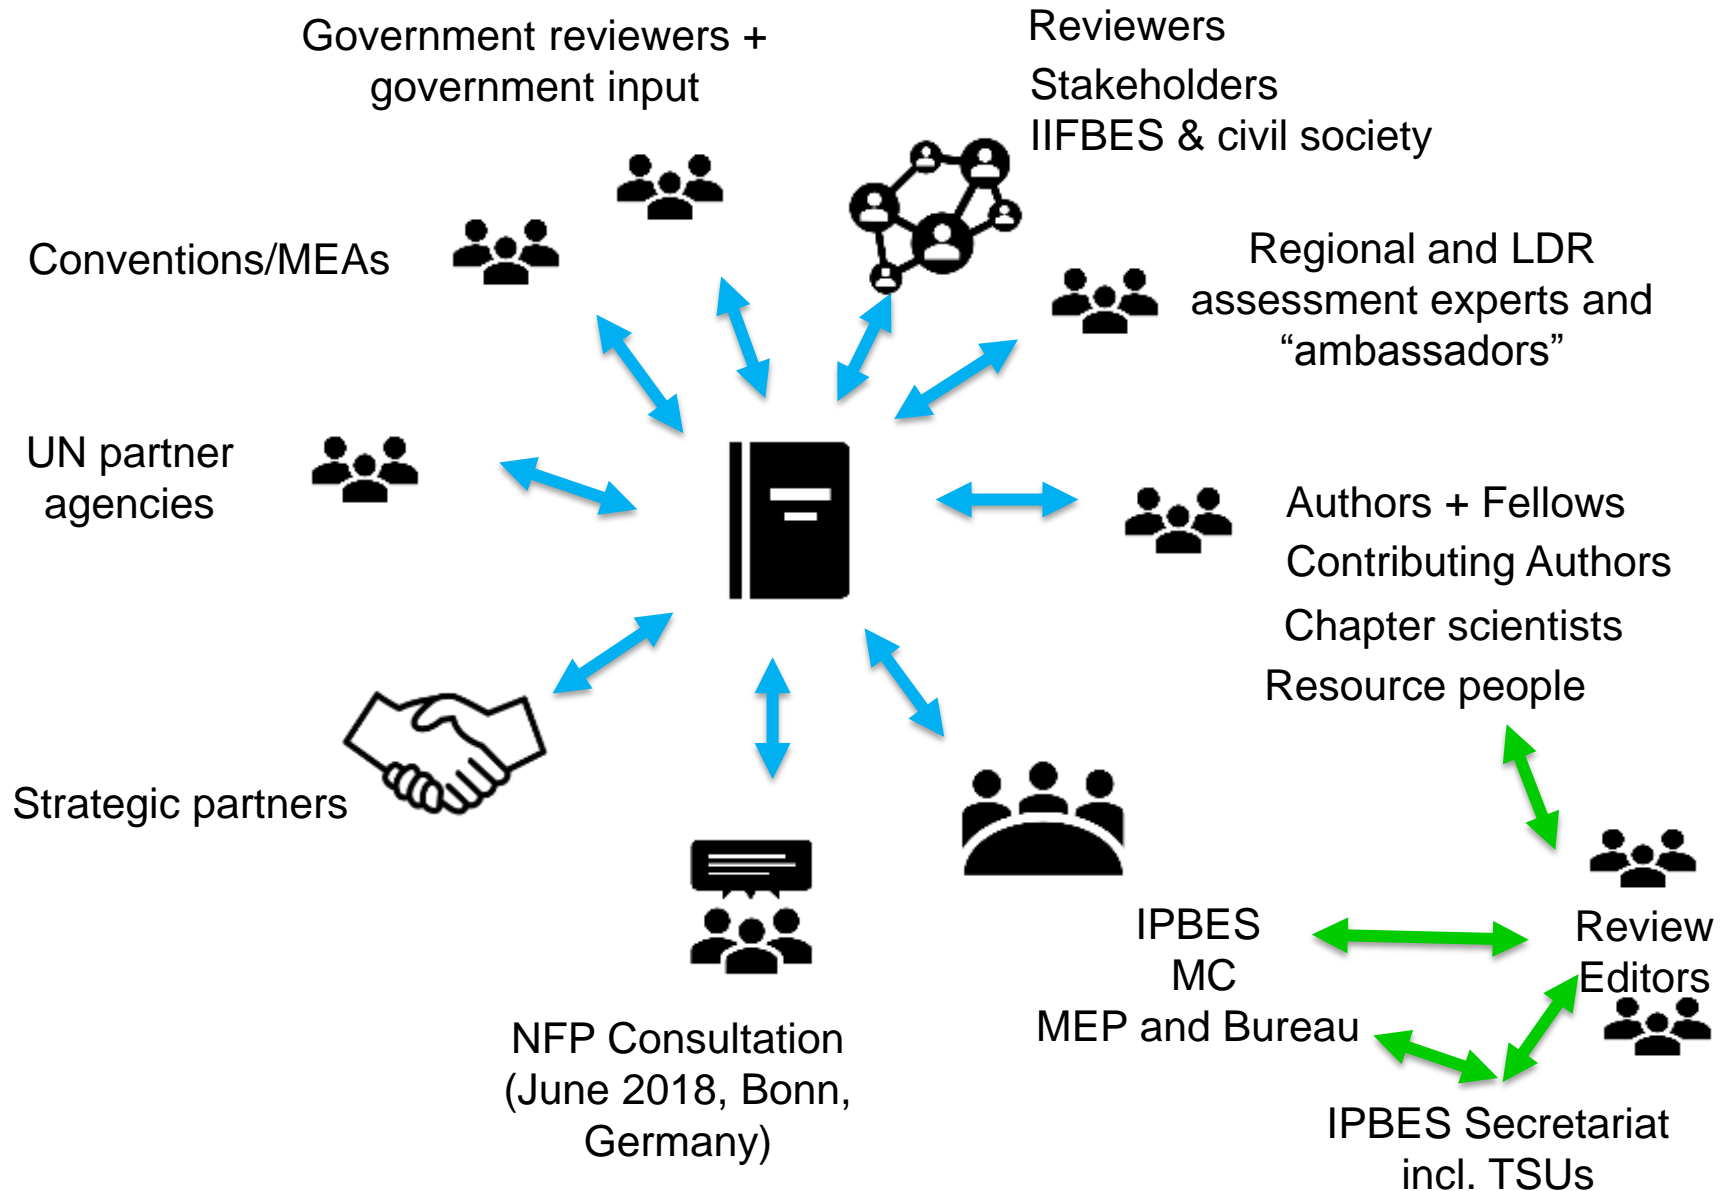

Josef Settele
(co-chair)

Max Gueze (TSU)

A co-produced Summary for Policymakers

**Nature underpins and sustains
human quality of life**

**Nature and its vital
contributions to people are
deteriorating worldwide**

More food, energy and materials than ever before are now being supplied to people across distant regions

Global trends in nature's contributions to people since 1970

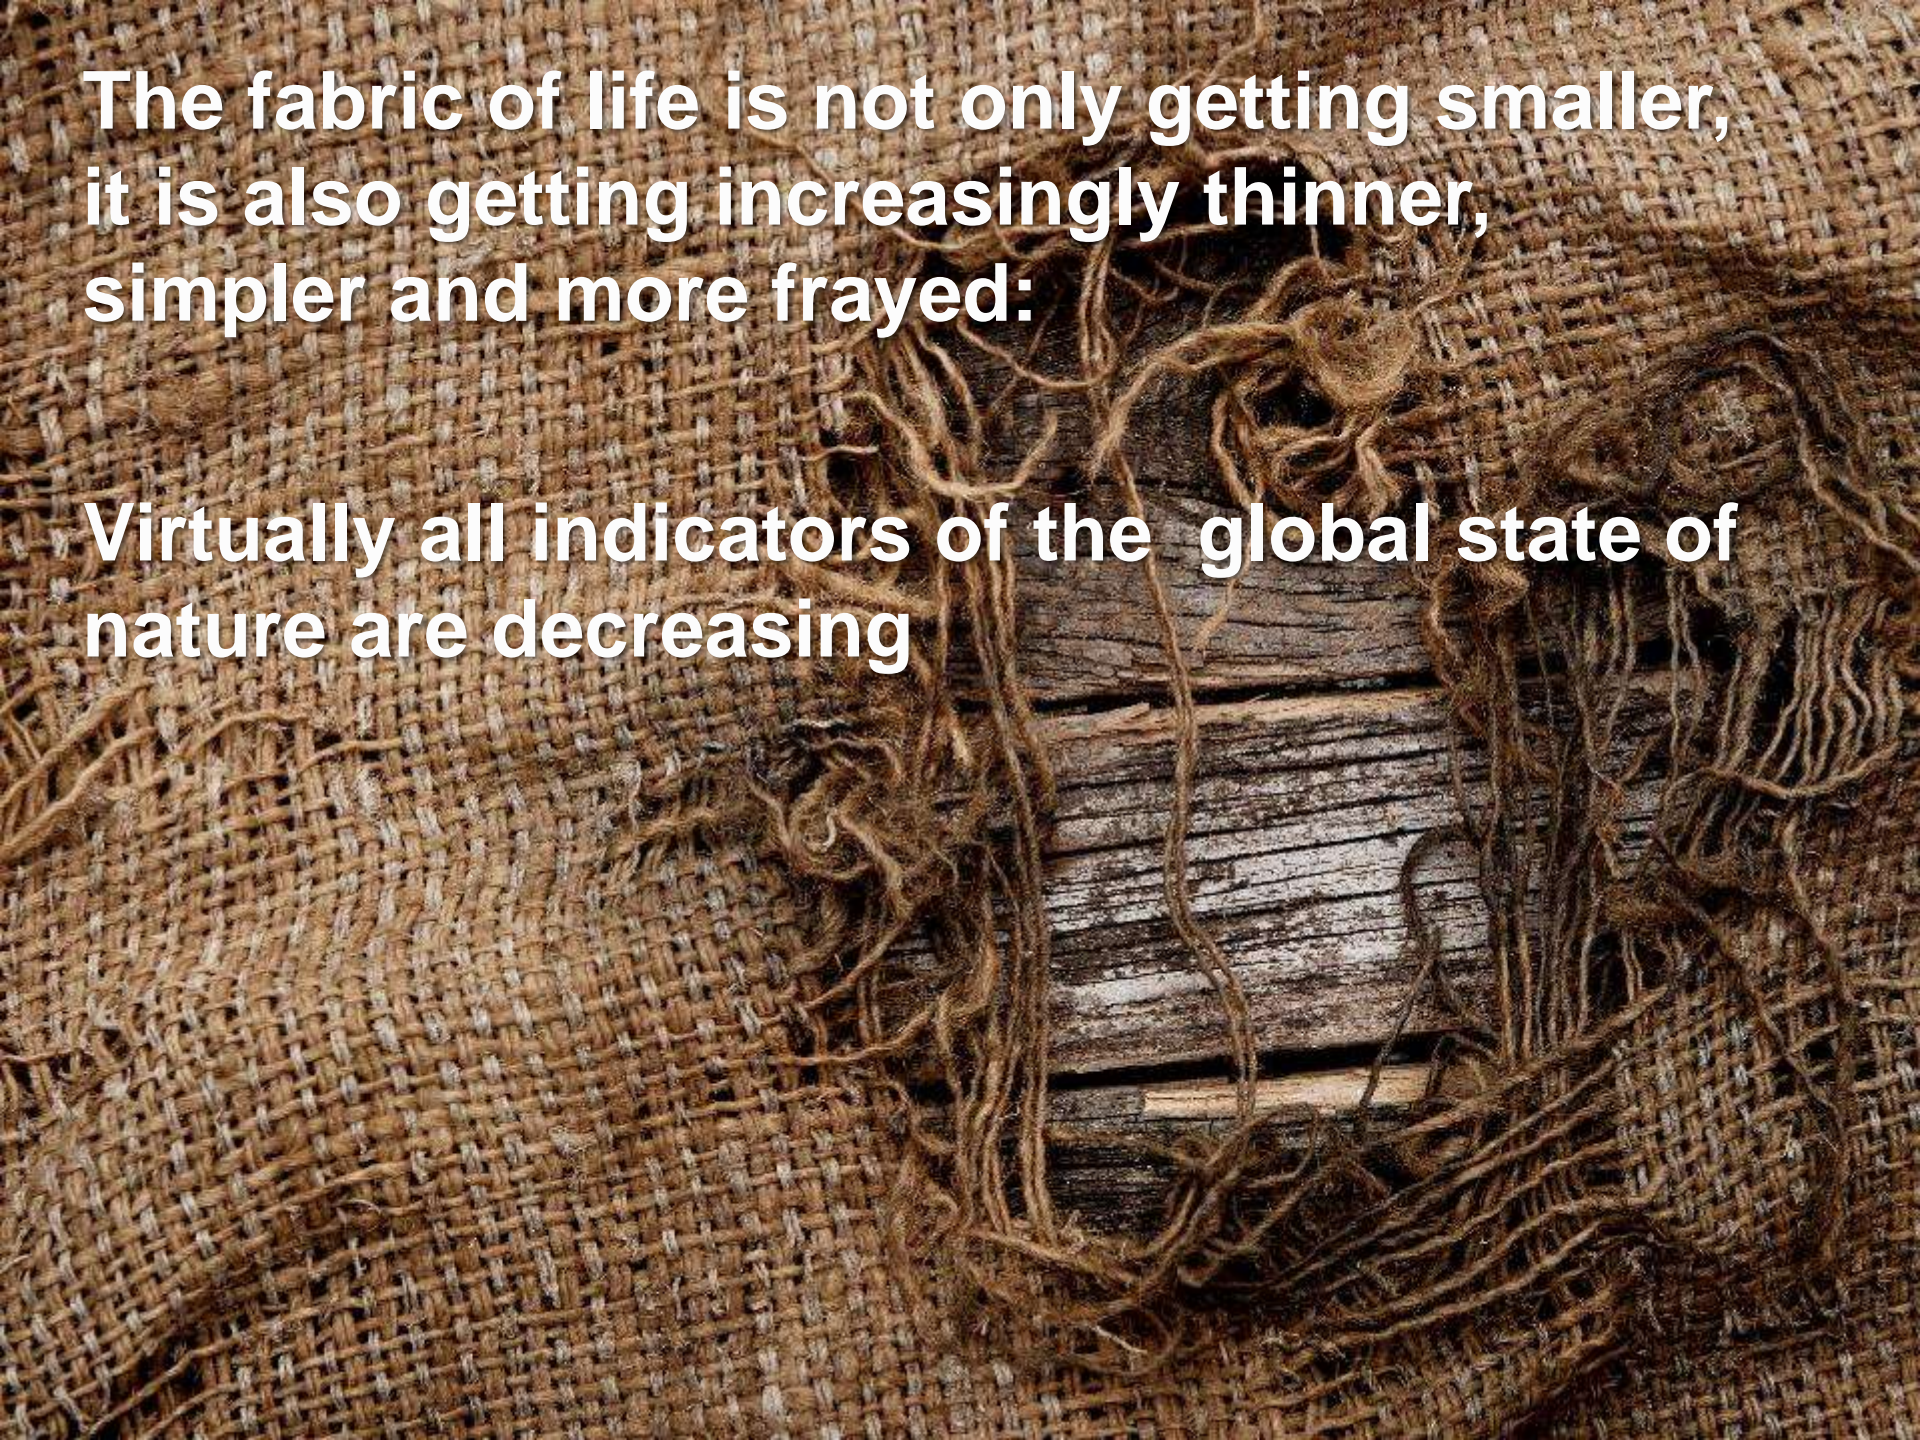

**The fabric of life on Earth is deteriorating
fast worldwide**

**The fabric of life is not only getting smaller,
it is also getting increasingly thinner,
simpler and more frayed:**

**Virtually all indicators of the global state of
nature are decreasing**

An aerial photograph of a wetland landscape. A dark, winding waterway or canal cuts through a vast, flat area of land. The land is covered in dense, low-lying vegetation, appearing in shades of brown, tan, and yellow. The waterway is dark and reflects the sky. The overall scene is a natural, undisturbed wetland environment.

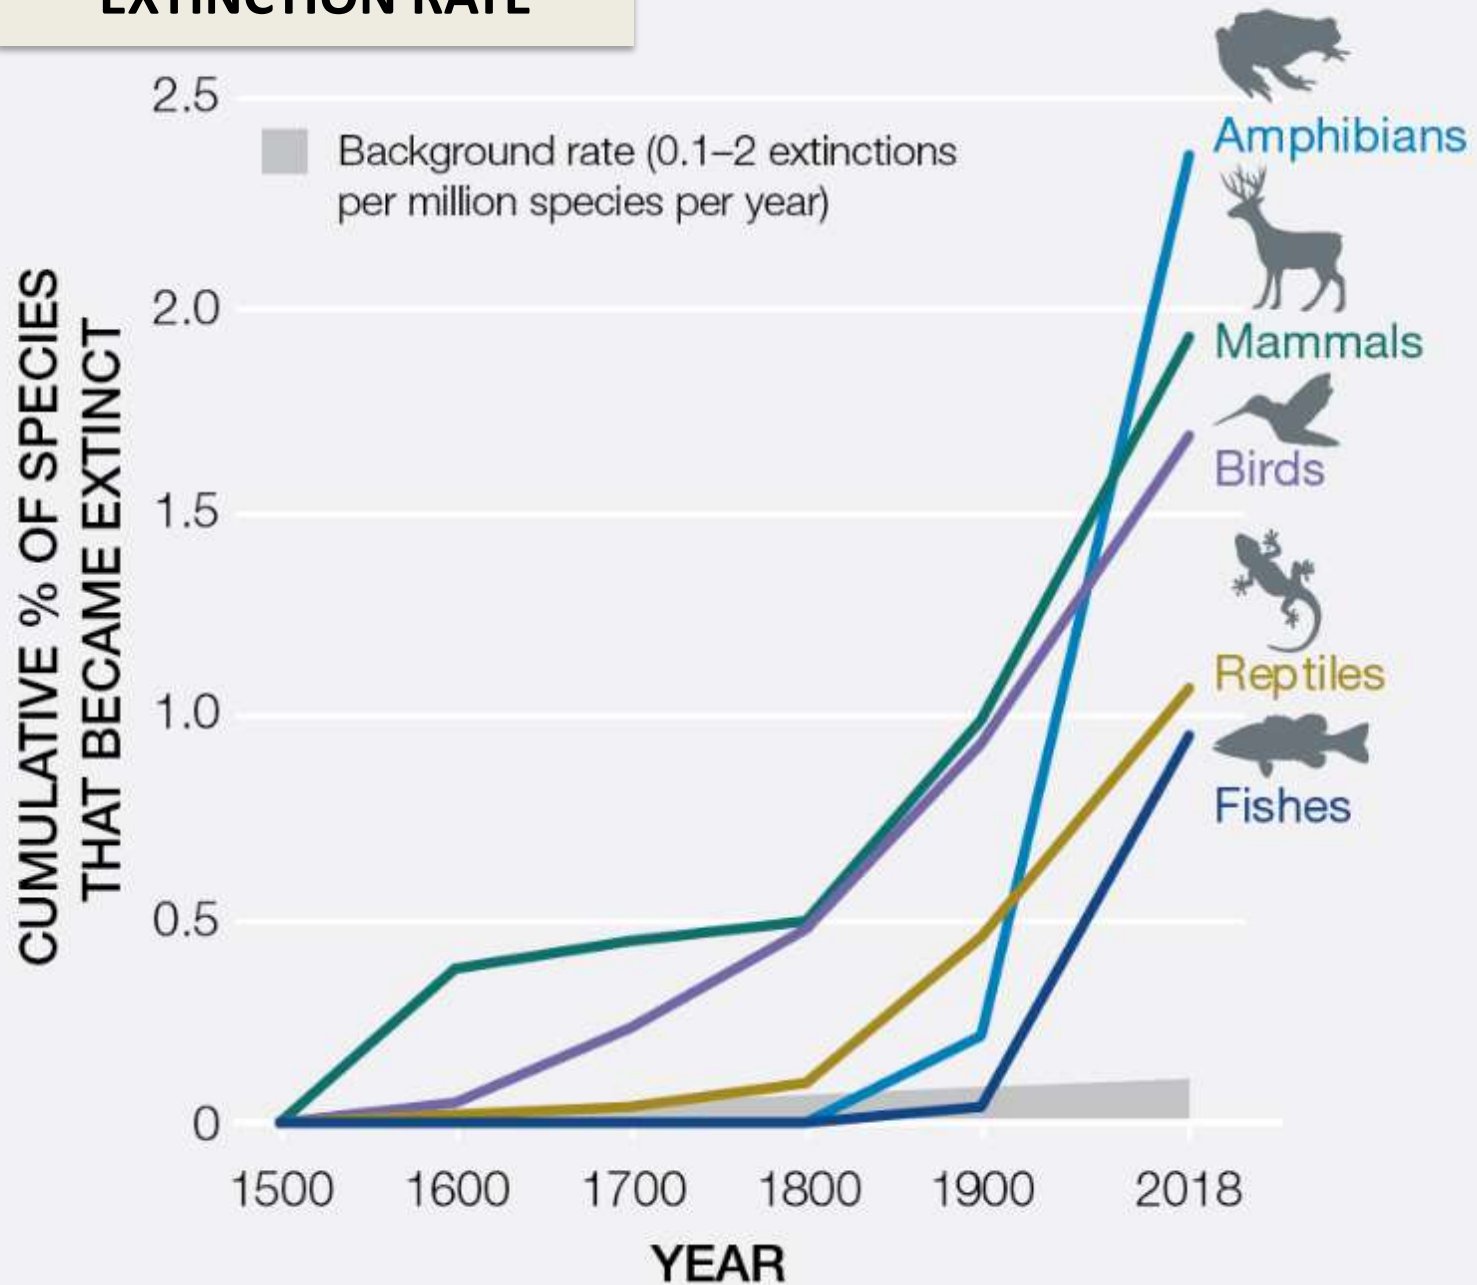

The biosphere and atmosphere, upon which humanity as a whole depends, have been deeply reconfigured by people.

75% of the land area is very significantly altered;
66% of the ocean area is experiencing increasing cumulative impacts;
>85% of wetland area has been lost.

More species of plants and animals are threatened with extinction now **than at any other time in human history.**

EXTINCTION RATE

The number of local varieties and breeds of domesticated plants and animals has decreased sharply

Proportion of the world's mammal and bird breeds by risk status category

Drivers of change have accelerated during the past 50 years to levels unprecedented in human history

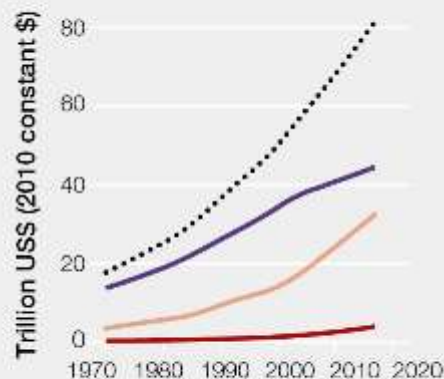

Underpinning the proximate causes of deterioration in nature are the root causes, or **indirect drivers of change**.

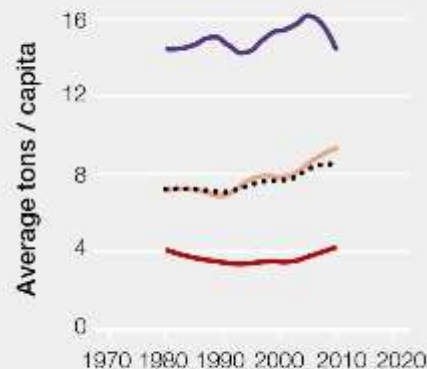

Global trends and regional asymmetries in development, production and consumption

A Gross domestic product (GDP)

B Domestic material consumption

C Extraction of living biomass (domestic consumption and exports)

- c. 4-fold increase in the global economy
- c. 10-fold increase in global trade

D Protection of Key Biodiversity Areas

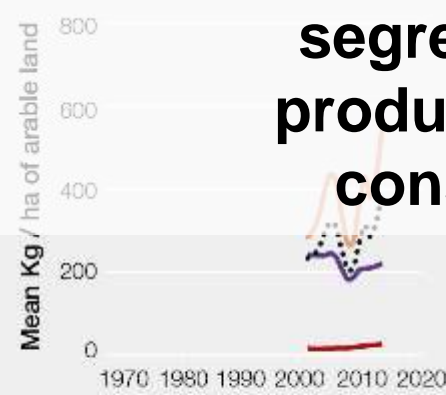

E Air pollution

*Fine particles: < 2.5 micrograms

F Fertilizer use

- Increasing spatial segregation of production and consumption

— Developed

— Developing

— Least developed

..... World

Contributions of Indigenous Peoples and Local Communities: knowledge, innovations, practices, and institutions

DOMESTICATION

a Domesticating and maintaining crops...

b ... and animal breeds

CREATING NEW ECOSYSTEMS

c Creating cultural landscapes with enhanced habitat heterogeneity

d Developing production systems with a multitude of domestic and wild species

PROTECTION

h Preventing forest loss

SUSTAINABLE USE, MANAGEMENT, AND MONITORING

e Habitat management

f Wild species management

g Restoration

CONCEPTS

i Alternative values and worldviews

Progress towards the Aichi Biodiversity Targets (each symbol represents an element of the targets)

Goal	Target (abbreviated)	Progress towards elements of each target			
		Poor	Moderate	Good	Unknown
Drivers	 Awareness		~ ~		
	 Planning & accounting	✗	~ ~		
	 Incentives	✗ ✗			
	 Production & consumption	✗ ✗			
Pressures	 Habitat loss	✗ ✗			
	 Fisheries	✗ ✗			?
	 Agriculture & forestry	✗ ✗	~		
	 Pollution	✗ ✗			
	 Invasive alien species	✗ ✗		✓	?
	 Coral reefs etc	✗ ✗			
Status	 Protected & conserved areas		~ ~ ~ ~	✓ ✓	
	 Extinctions prevented	✗ ✗			
	 Genetic diversity		~ ~ ~ ~		?
Benefits	 Ecosystem services	✗			?
	 Ecosystem restoration				? ?
	 Access & benefit sharing		~	✓	
Implementation	 Strategies & action plans		~ ~	✓	
	 Indigenous & local knowledge		~ ~		? ?
	 Biodiversity science		~ ~		?
	 Financial resources		~		

Progress towards the UN Sustainable Development Goals (each symbol represents a target with close relation to Nature)

Selected Sustainable Development Goals	Recent status and trends in aspects of nature and nature's contributions to people that support progress towards target *			Uncertain relationship
	Poor/Declining support	Partial support	Unknown	
 No poverty	↓ ↓			U U
 Zero hunger	↓	→ → →		
 Good health and well-being			? ?	U U
 Clean water and sanitation	↓ ↓ ↓	→		
 Sustainable cities and communities	↓ ↓ ↓ ↓	→		
 Climate action	↓	→	? ? ?	
 Life below water	↓ ↓ ↓ ↓	→ → →		
 Life on land	↓ ↓ ↓ ↓ ↓ ↓	→ → → → →		

* There were no targets that were scored as good/positive status and trends

Plausible futures - Scenarios

Economic optimism

- rapid economic growth
- low regulation

Regional competition

- strong trade and other barriers
- growing gap between rich and poor

Global sustainability

- Proactive environmental policy
- Sustainable production and consumption

Projected changes in biodiversity and nature's material and regulating benefits, due to climate & land use change by 2050

Plausible scenarios, which include transformative change, are compatible with the 2030 sustainability objectives and the 2050 Vision for Biodiversity.

Changes in production and consumption of energy and food

Low to moderate population growth

Nature-friendly and socially fair climate adaptation and mitigation

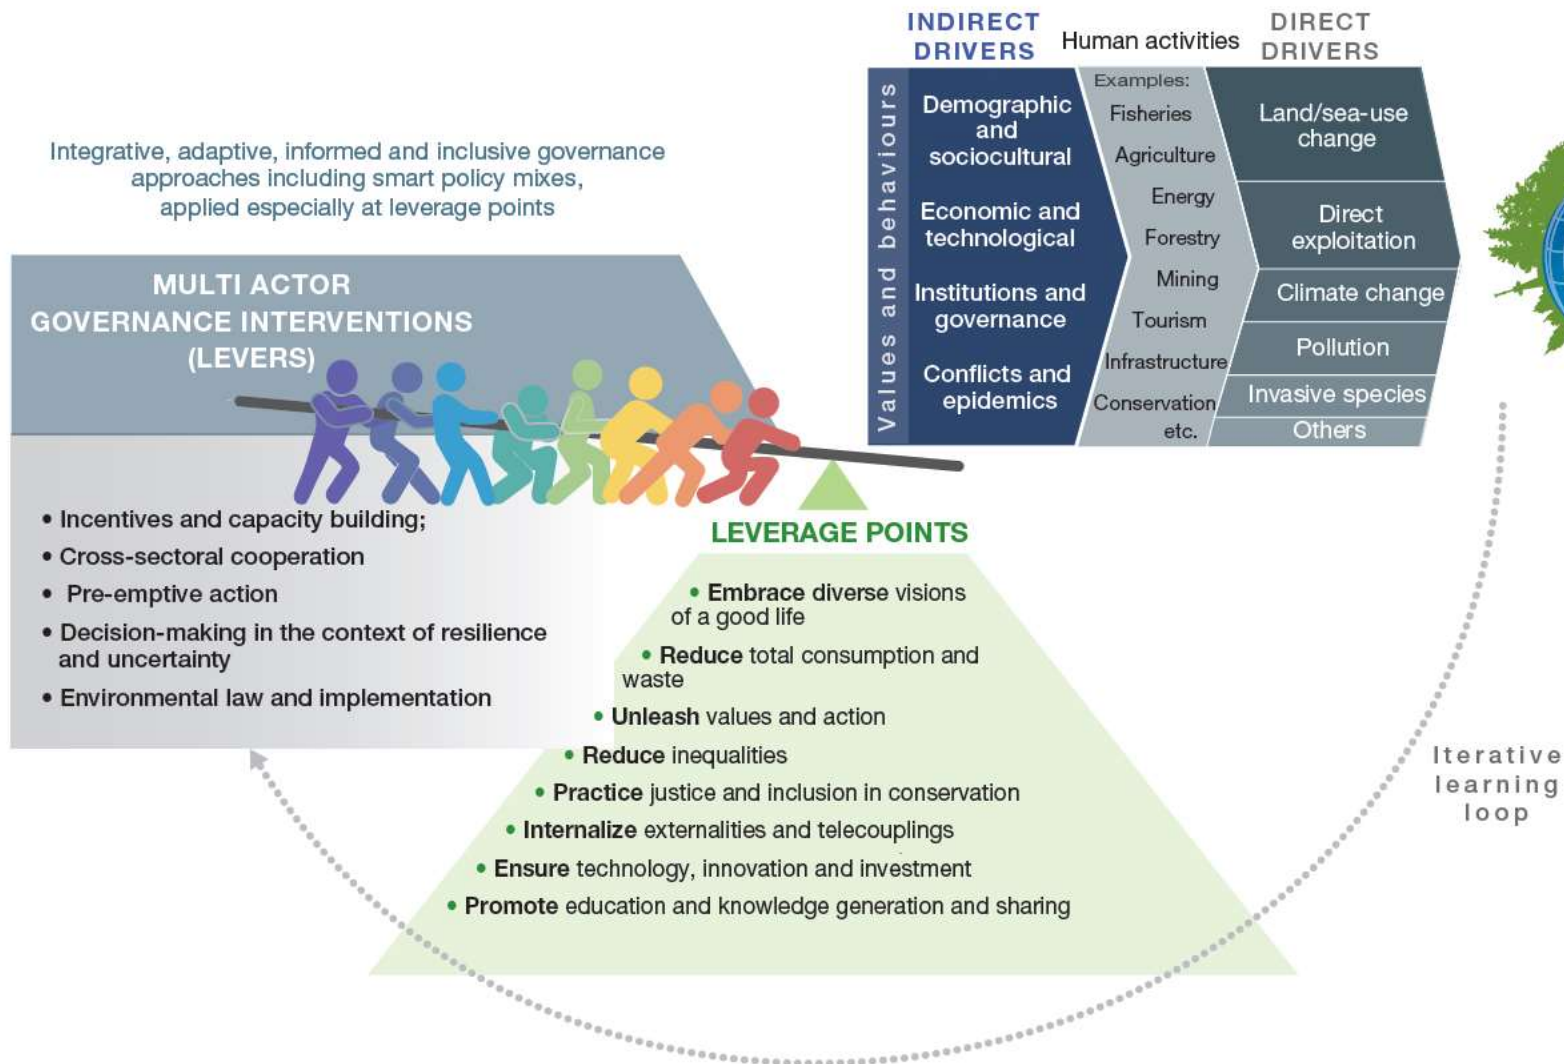

We have dramatically reconfigured the fabric of life of the planet.

The world is becoming much more interconnected, yet increasingly unequal.

Options for the futures we want

Options for the futures we want

**Confronting the challenge of
meeting international societal and
environmental goals for the next
decades**

**Key components for
transformation**

**Challenges related to climate change,
nature deterioration and achieving a
good quality of life for all are
interconnected.**

**Therefore they need to be addressed
synergistically, from local to global
levels.**

**Need for rapid implementation of
existing instruments and bold
decisions for transformative
change.**

**Knowledge and tools available,
they simply need better
deployment and implementation.**

Meeting global societal goals through urgent and concerted efforts addressing the direct drivers and especially the root causes (indirect drivers) of nature deterioration:

- **Governance**
- **Economic systems**
- **Equity**
- **Cross-sectorial planning**
- **Incentives**
- **Social narrative and values**

Cross-Sectoral, Integrated Management at Multiple Levels

→ Food production and conservation goals: complementary and interdependent.

→ Sustainable fisheries: integrated management on land, in freshwater and oceans.

→ Land-based climate change mitigation: attention to trade-offs.

→ Nature-based solutions in cities: crucial for global sustainability.

Recognizing the knowledge, innovations and practices, institutions and values of indigenous peoples and local communities and their inclusion and participation in environmental governance.

Enhances their quality of life, as well as nature conservation and sustainable use, relevant to broader society.

A key constituent of sustainable pathways is the evolution of global financial and economic systems to build a global sustainable economy.

One that steers away from the current limited paradigm of economic growth.

Many societal responses and successful examples, rapid transformative change is already happening in many sectors, just not at the scale needed to match that of the crisis.

Bold actions and commitment from local to global levels urgently needed.

Options for the futures we want

Possible actions and pathways to achieve transformative change

Building **sustainable cities** that address critical needs while conserving nature, restoring biodiversity, maintaining and enhancing ecosystem services

Sustainable cities

- Engaging **sustainable urban planning** (e.g. G, CG, IPLC, NGO, P) {6.3.5.1} (D9)
- • Encouraging densification for compact communities, including brownfield development and other strategies **{6.3.5.3}**
- Including biodiversity protection, biodiversity offsetting, river basin protection, and ecological restoration in regional planning {6.3.5.1}
- Safeguarding urban key biodiversity areas and ensuring that they do not become isolated through incompatible uses of surrounding land {6.3.5.2; SM 6.4.2}

Sustainable cities

- Promoting biodiversity mainstreaming through stakeholder engagement and integrative planning (e.g. G, NGO, CG, IPLC) {6.3.5.3}, thus encouraging alternative business models and incentives for urban conservation {6.3.2.1}
- Promoting sustainable production and **consumption** {6.3.6.4}
- **Promoting** nature-based solutions (e.g. G, NGO, SO, P) {6.3.5.2} (D8, D9)

Sustainable cities

- Promoting, developing, safeguarding or retrofitting **green and blue infrastructure** (for water management) while improving grey (hard) infrastructure to address biodiversity outcomes {6.3.5.2}
- Promoting ecosystem-based adaptation within communities {3.7; 5.4.2.2}
- Maintaining and designing for **ecological connectivity within urban spaces**, particularly with native species {6.3.5.2; 6.4.1}
- **Increasing** urban green spaces and improving access to them {6.3.2}

Building sustainable cities (in a subjective nutshell)

- Limit urban sprawl
- Promote low impact public transportation, nature sensitive road networks
- Expand vegetation cover, promote urban gardens
- Manage for ecological connectivity
- Promote sustainable water and solid waste management

In a nutshell

- Most comprehensive global picture of the links between nature and people in recent times ever produced.
- Trends worrying and clearly unsustainable
- A call for action:
 - Prompt action (go further and faster)
 - Tackling the roots causes of nature's deterioration
 - Coordinated and integrated across sectors and scales

 ipbes merci !
